Omicron:

What we know right now. The Omicron variant is causing a fast increase in cases in many parts of the US and other countries. This variant has been detected in Wisconsin. The following information is from the Centers for Disease Control

Image 2 text

Who is most at risk? People at the highest risk for serious illness are individuals who are:

- Unvaccinated
- Vaccinated more than 6 months ago
- Age 50+ or older
- Pregnant
- Living with underlying health conditions (overweight/obese, ever smoked, diabetic, others)

Prior infection does not guarantee protection from any variant.

Boosters Work

People who have been vaccinated in the last 6 months or have gotten their booster are more likely to have a mild case of COVID-19 if a breakthrough infection occurs. Includes image of graph to show this.

Protect our Community.

- Mask up: Well-fitting masks in public indoor spaces are still recommended to protect yourself and others, even if you're vaccinated
- Talk to your friends and family: Help members of your family make vaccine appointments, and share this page for reliable information
- Stay home if you're sick and encourage others to do the same
